

Team Atmosphere

Alice Ni, Moody Rahman, Joseph Yusuf, David Wang

ROLES:

Alice - PM, Bootstrap

Moody - Database, python

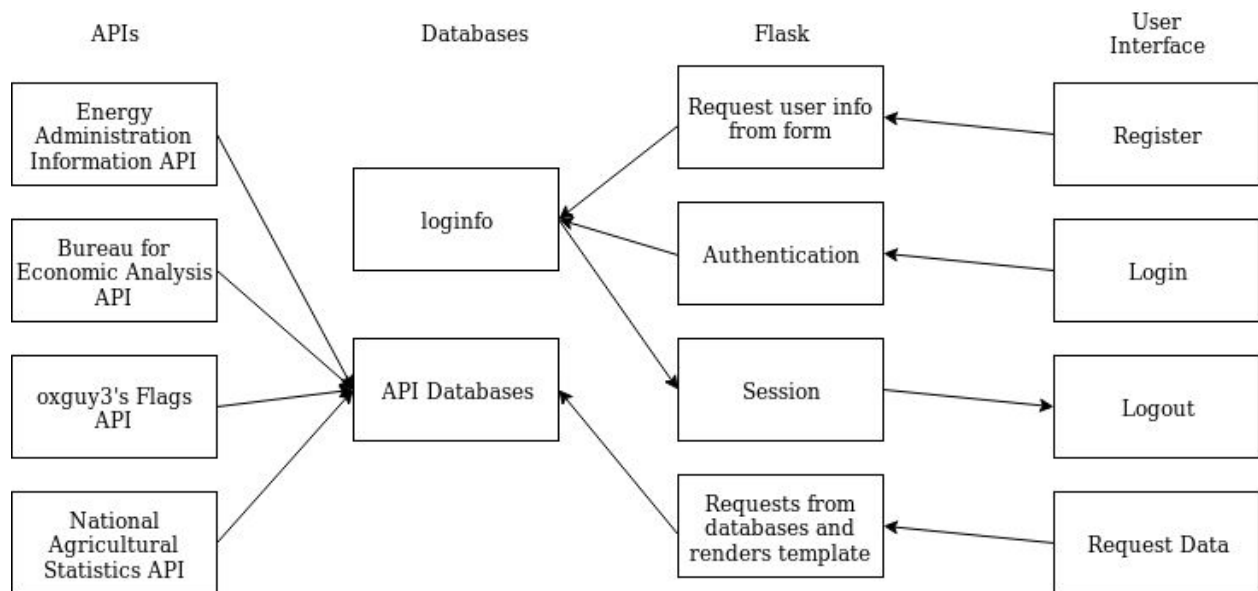

Joseph - API, Bootstrap

David - Python, HTML

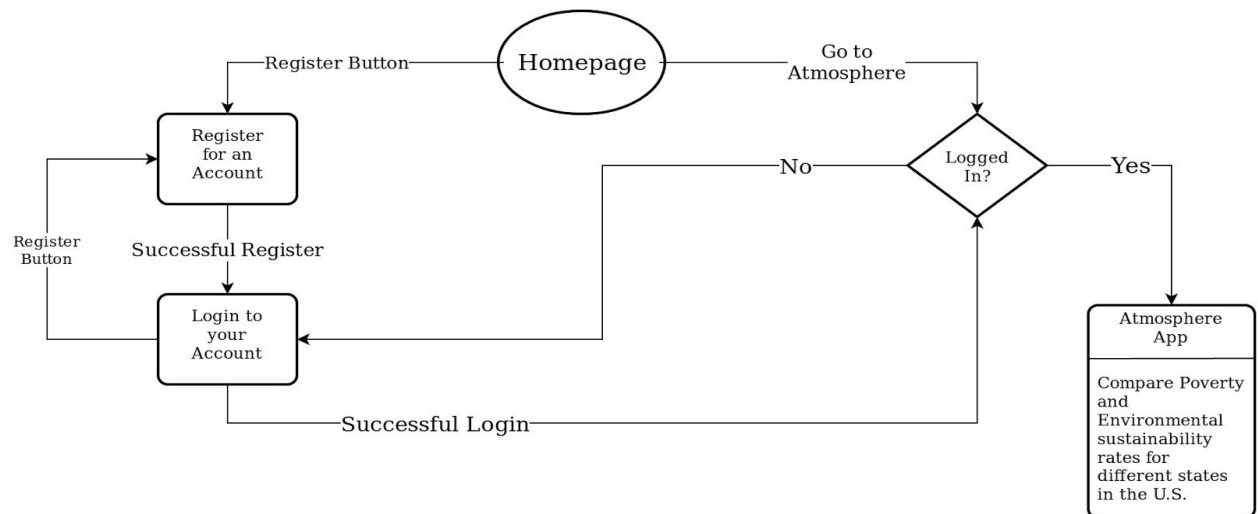

Functionality

- Interactive website that allows users to view and compare data from different states
- A few built-in data variables, stored as JSON files in a JSON file folder
 - Population per state
 - Income
 - Carbon emissions
- Users can choose the variables they want to compare, making a request to a Flask app that reads from the databases.
- Users can either explore state specific data or choose to analyze by indicators. They can add their favorite states which will show up on their dashboard.
- The data will be stored in JSON files relative to each API used. API information will be cached into the files as they are requested by users.
- Scattergrams and charts will be generated by the parameters specified by the user. Displays information in a table numerically as well.
- API's used:
 - U.S. National Agricultural Statistics API
 - U.S. Bureau for Economic Analysis API
 - U.S. Energy Information Administration API
 - oxguy3's "flags" API
 - CanvasJS Graphing API
- Implements bootstrap
 - Navbar
 - Charts
 - Tables
 - Flashed messages
 - Containers

Database Layout

loginfo

username TEXT	password TEXT
"jimbob"	"cooljoe23"
"hamlet"	"macbeth"

username: displayed name for each account, entered by the user

password: entered by the user

<username>

favorites TEXT
"CA"
"NY"

Table name: There exists one favorites table for each user that wishes to track favorite states, and this table is named the user's username

favorites: Alpha codes for states, a new row for each favorite state in a user's table.

Front End

- base.html
 - Base template for all the pages
- index.html
 - Extends base.html
 - User **must** login or register for an account before viewing the site
 - Instructions on how to navigate the site
 - Buttons to register/login
- login.html
 - Extends base.html
 - Form for submitting an existing username or password
- register.html
 - Extends base.html
 - Form for creating an account
- welcome.html
 - Extends base.html
 - Home page that displays real-time data for the U.S. as a country (total U.S. population, carbon emissions, flag, etc.)

- “Stats by State” button- Option for user to select a single state and view all the available statistics for that state via a radio form
- “Analysis by Indicators” button - Option for user to select and compare two variables via a form
- Submit button brings the user to another page that displays all the requested data
- lookup.html
 - Extends base.html
 - Page that displays the specified data in a table
 - User can choose to add a state to their favorites list, and that will pop up in their dashboard
- analysis.html
 - Extends base.html
 - Allows users to choose independent and dependent variables
 - Generates a scattergram and graph that displays the requested variables and the 50 states are the points on the scattergram
 - Generates a table that displays the information numerically

Back End

- app.py
 - Login system
 - Registration system
 - Routes
 - “/”
 - Renders “index.html” if user not logged in
 - Renders “welcome.html” if user logged in
 - “/login”
 - Renders “login.html”
 - Redirect to “/home”
 - “/register”
 - Renders “register.html”
 - Redirect to “/”
 - “/welcome”
 - If user is not logged in, redirect to “/”
 - Renders “welcome.html”
 - Displays
 - “/lookup”
 - Renders “lookup.html”
 - Displays form that allows users to choose a state
 - “/analysis”
 - Renders “analysis.html” using data from cache file
 - Processes user-chosen arguments for the graph and table
 - “/logout”

- Removes user from Sessions
 - Redirects to "/"
 - "/auth"
 - Will never be displayed to user
 - Checks if user is in session
 - "/favadder"
 - Allows the user to add to their favorite states list
 - Each user has their own database that contains their favorite states
- cache.py
 - Enters all relevant data points into a JSON cache every time that the server is started, and alerts the user when caching is complete.

Functions

- login()
 - @param: username
 - @param: password
- register()
 - @param: username
 - @param: password
 - Cannot register a username already in use
- welcome()
 - @param: username
- login()
 - Renders index.html
- auth()
 - @param: username
 - Checks if user is in session
- lookup()
 - @param: username
 - Makes requests to the API depending on the request the user makes
- analysis()
 - @param: username
 - Generates a graph and a table based on what the user requested through the data form. Takes in the independent and dependent variables
- favadder()
 - @param: username
 - Puts into a user-specific database, their chosen favorite states
- logout()
 - Logs out the user
